Independent Contractors and the Emerging Gig Economy

WILL RINEHART, BEN GITIS | JULY 29, 2015

SUMMARY

The rise of the so-called “gig economy” and the increasing use of independent contractors has captured the attention of policymakers. Nontraditional work arrangements are hardly a new development in the American economy, yet there is the perception that smartphone apps and online marketplaces have led to a sharp increase in nontraditional work and even a new class of jobs. The goal of this short paper is to survey the limited available data to shed light on the magnitude of these labor force developments.

Our analysis covers two aspects of work arrangements: (1) the gig economy – workers with alternative work arrangements, and (2) the online gig economy – workers who utilize new technologies, markets and platforms for alternative work arrangements. In addition we touch on related developments in product markets giving rise to the “sharing economy” – goods and services that employ under-utilized assets via online marketplaces or decentralized networks.

We find that the number of workers in the gig economy grew between 8.8 and 14.4 percent from 2002 to 2014. For comparison, overall employment increased by 7.2 percent over the same period. Independent contractors constitute a significant portion of gig workers, and grew by 2.1 million workers from 2010 to 2014, accounting for 28.8 percent of all jobs added during the recovery. The online gig economy has experienced significant growth as well. Faster growth in taxis and boarding rooms since the arrival of companies like Uber, Lyft, and Airbnb indicates that online gig jobs are transforming the labor force. In particular, the data suggest that the ride sharing industry has helped bring in an additional \$519 million in economic activity from 2009 to 2013, and created 22,000 jobs in the sector.

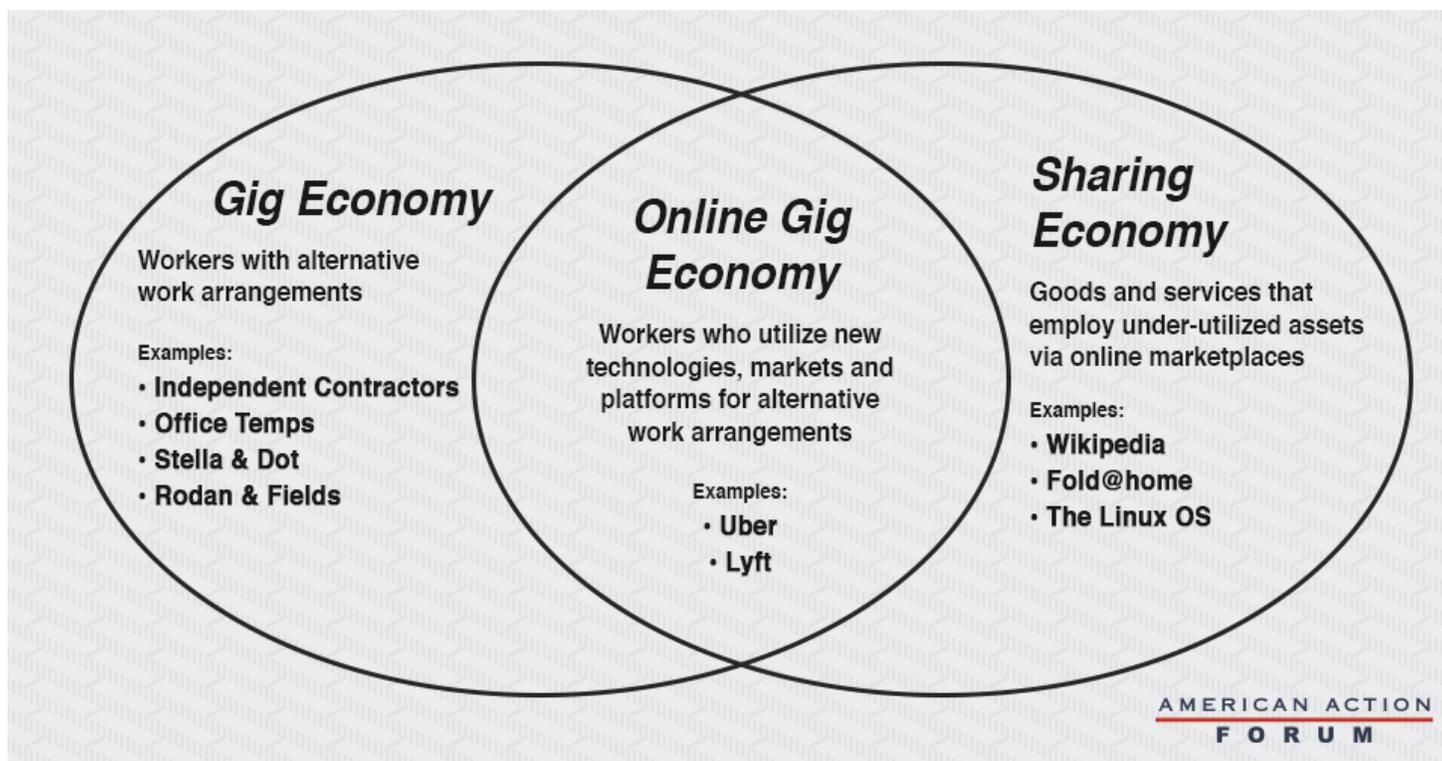

DEFINING THE GIG AND SHARING ECONOMIES

A common phrase for the businesses and workers that are marked by alternative jobs that are usually temporary and influenced by technology is the gig economy. Gig workers are mostly independent contractors and freelancers. The workers who could also be considered gig workers include agency temps, on-call workers, contract company workers, self-employed workers, and standard part-time workers.

A related concept in product markets is the sharing economy; services and goods that employ under-utilized assets via online marketplaces or decentralized networks for both monetary and non-monetary benefits.^[i] For example, if you have extra time, you can contribute to Wikipedia or Linux. If you have an idle computer, you can download the program and help advance medical research and cancer drug design.^[ii]

Though still in the early stages of development, some sharing economy business models adopt the alternative worker arrangements of the gig economy. Uber, Lyft, and Airbnb are just a few examples of how companies are merging the temporary work arrangements of the gig economy with the sharing aspects of an online

marketplace.^[iii] The chart below illustrates the relationships between the concepts. The employment conditions for the workers who fall under this category are frequently the topic of policy discussions. So in addition to evaluating the overall gig workforce, we analyze the trends in this subset of the gig economy, which we will refer to as the online gig economy.

QUANTIFYING THE GIG ECONOMY WORKFORCE

There is no official classification for gig economy workers. We can, however, use estimates of the size of the contingent workforce to provide insights into these workers. The Government Accountability Office (GAO) recently examined the entire contingent workforce. Under its broadest definition, GAO found that in 2010, 40.4 percent of workers were contingent employees.^[iv] This definition of contingent workers included anyone who was not a standard full-time employee; i.e., it encompassed agency temps, on-call workers, contract company workers, independent contractors, self-employed workers, and standard part-time workers. Under its more narrow definition, GAO estimated that 7.9 percent of the workers were “core” contingent workers. This only included agency temps, on-call workers, and contract company workers.^[v]

The actual number of gig economy workers likely falls in between these two ranges. For instance, the majority of standard part-time workers are in construction, manufacturing, retail, education services, and accommodation and food services, which are not necessarily the type of industries associated with smartphone apps and software specialists. Meanwhile, independent contractors and freelancers, who are excluded from GAO’s core contingent category, likely consist of the gig economy workers.

Using data from the General Social Survey (GSS)^[vi], a statistical survey conducted by University of Chicago’s National Opinion Research Center, we can proxy the workforce trends of the contingent worker categories that are most representative of the gig economy. These trends are illustrated in Table 1.^[vii] For our most narrow measurement of gig workers (labeled Gig 1) we simply include independent contractors, consultants, and

freelancers. Our middle measurement (Gig 2) includes all Gig 1 workers plus temp agency workers and on-call workers. Our broadest measurement (Gig 3) includes all Gig 2 workers plus contract company workers.

Year	Gig 1	Gig 2	Gig 3
2002	18.9 million	22.7 million	26.0 million
2006	19.7 million	24.8 million	30.0 million
2010	18.5 million	25.4 million	29.7 million
2014	20.5 million	25.8 million	29.7 million

Overall, we estimate that in 2014 there were 20.5 million to 29.7 million people in the alternative work arrangements that are often featured in the gig economy, constituting 14.0 percent to 20.3 percent of all employed people.

GROWTH IN GIG WORKERS IN THE 21ST CENTURY

From 2002 to 2014, gig workers grew at a rapid pace, despite taking a hit during the recession.^[viii]

Worker Type	Percent Growth
Total Employment	7.2%
Gig 1	8.8%
Gig 2	13.9%
Gig 3	14.4%

During that time period, total employment increased by 7.2 percent. Meanwhile workers in the gig economy expanded between 8.8 percent and 14.4 percent. As a result, while independent contractors (Gig 1) made up 14.0 percent of the workforce in 2014, they represent 16.9 percent of all new jobs added during the previous 12 years. Our broadest measure of gig workers (Gig 3) indicates that they accounted for up to 38.2 percent of job growth.

Growth in independent contractors was particularly rapid during the recent recovery. From 2010 to 2014, we estimate that independent contractors increased by 2.1 million workers, accounting for 28.8 percent of all jobs added during that time period.

TRENDS IN NON-EMPLOYER ESTABLISHMENTS AND THE ONLINE GIG ECONOMY

Standard labor data also do not easily reveal employment changes due to the online gig economy. For example, Etsy, the online marketplace, found through surveys that only 48 percent of its sellers would consider their work on the site as independent work; either a full time, part time, or temporary.^[ix] About 24 percent of all sellers identify themselves as unemployed. Another 26 percent of sellers have full time jobs other than their Etsy store. Standard labor market surveys would probably underreport these workers, even though they receive income via one of the biggest companies in the online gig economy. Etsy also found that only 2 percent of sellers are incorporated. Meanwhile, 90 percent of sellers are sole proprietorships, and by their very definition have no employees.

To proxy the growth of the online gig economy, we use Census data for businesses that have no paid employees and pay federal income tax. These nonemployer establishments illustrate the rise of the online gig economy. Table 3 shows recent data for nonemployer establishments and their average receipts.

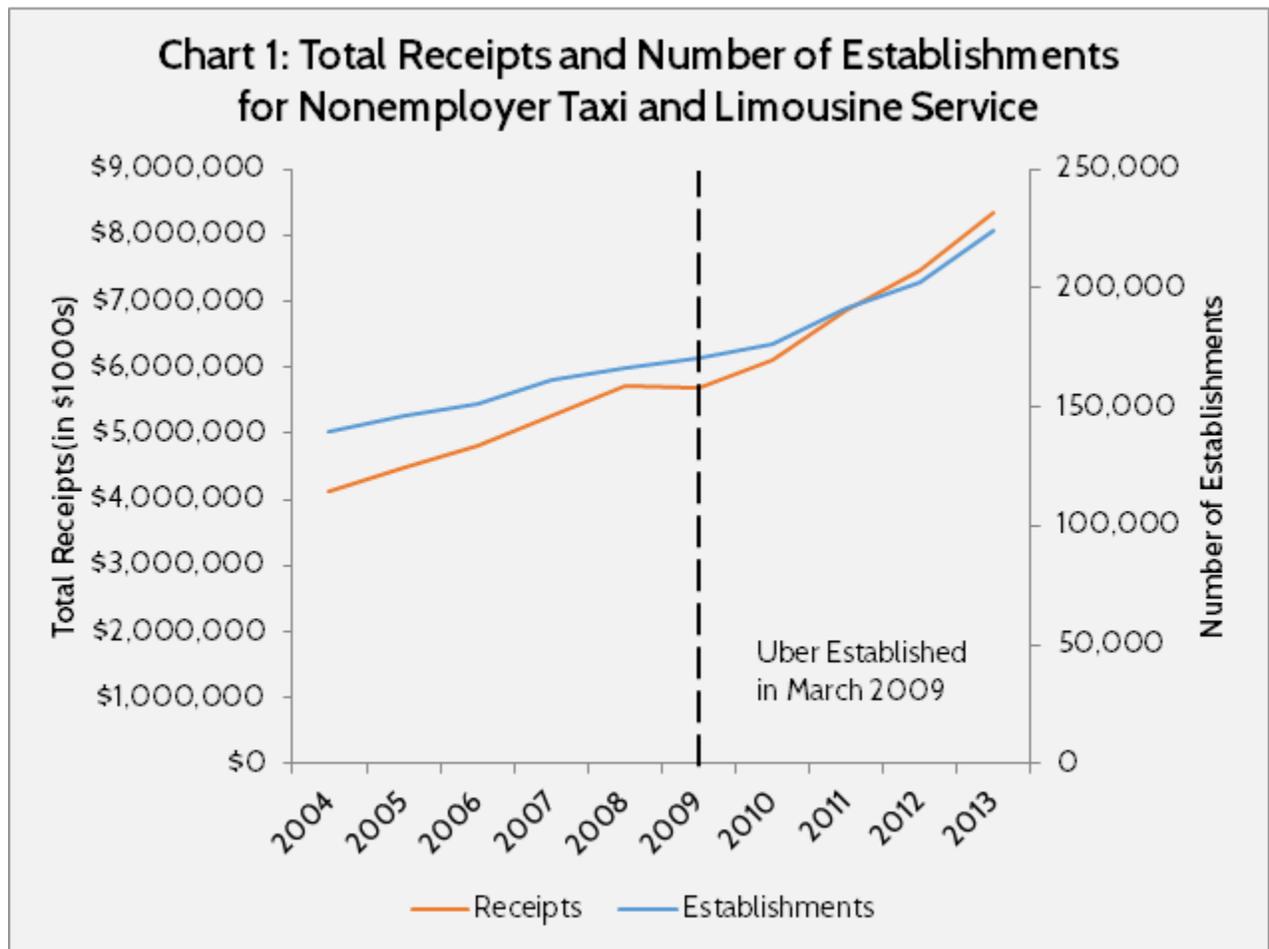

Table 3: Trends in Nonemployer Establishments

	Total Nonemployer Establishments	Receipts (in \$1,000s)	Average Receipt / Establishment
2002	17,646,062	770,032,328	\$43,638
2003	18,649,114	829,819,228	\$44,496
2004	19,523,741	887,001,820	\$45,432
2005	20,392,068	951,206,297	\$46,646
2006	20,768,555	970,384,137	\$46,724
2007	21,708,021	991,791,563	\$45,688

2008	21,351,320	962,791,527	\$45,093
2009	21,695,828	923,018,039	\$42,544
2010	22,110,628	950,813,840	\$43,003
2011	22,491,080	989,628,512	\$44,001
2012	22,735,915	1,030,932,886	\$45,344
2013	23,005,620	1,052,025,268	\$45,729

Since the beginning of the recovery in 2009,^[x] nearly 1.3 million new nonemployer establishments were created, outpacing growth in total employer establishments to become nearly 75 percent of all businesses. From 2009 to 2013, these companies had \$129 billion in additional receipts, which translates to a 14 percent increase over this time period. Of the nearly 270,000 nonemployer businesses added between 2012 and 2013, three sectors accounted for 60 percent of the growth: other services; real estate, rental and leasing; and transportation and warehousing.^[xi]

The growth in companies like Airbnb, Lyft, and Uber coincides with the significant gains in the transportation and warehousing sector, suggesting that these companies have likely driven nonemployer establishment growth. For instance, from 2002 to 2008, the number of new taxi and limousine companies increased at an average rate of 4.3 percent per year. After Uber was established, the average annual growth rate in taxi and limousine companies jumped to 7.0 percent from 2009 to 2013.^[xii] Similarly, the total receipts from 2002 to 2008 increased at an average annual rate of 8.3 percent, and then jumped to 10.1 percent from 2009 to 2013. Moreover, growth in receipts has accelerated in recent years as the number of new nonemployer establishments and the total receipts each increased by 11 percent in 2013 alone. The faster growth since ride sharing companies entered the market has led to significant economic advances in the taxi and limousine industry. In 2013 taxi and limousine receipts were about \$519 million higher than they would have been had the pre-ride sharing growth continued since 2009. That's about 19.5 percent of the \$2.7 billion in growth in receipts since 2009. Similarly, there were 22,000 more nonemployer establishments, which probably equates to 22,000 unique jobs. That means the accelerated growth since ride sharing companies formed accounts for 41.3 percent of nonemployer establishments created since 2009.

The rideshare industry is not the only part of the online gig economy to see rises in usage. Before Uber, Lyft, Sidecar, and others were turning the taxi industry on its head, VBRO and others invited regular people to rent out their property as alternative living arrangements for vacationers. Soon after Airbnb was founded in late 2008, the total number of people offering their houses and apartments to others increased by 18 percent and total receipts increased by nearly 20 percent.

CONCLUSION

The gig economy is of rising importance in the overall U.S. economy. From 2002 to 2014, workers in the gig economy expanded between 8.8 percent and 14.4 percent. Independent contractors, most notably, helped put 2.1 million people to work, accounting for 28.8 percent of all jobs added from 2010 to 2014. The ride sharing industry alone helped bring in an additional \$519 million in economic activity from 2010 to 2013 for independent workers, while injecting 22,000 jobs into the sector. Though it is early, the online gig economy also seems to also be a growing piece of United States' economy of the 21st century.
